## 1.烫手山芋-09/28/2017

队列的问题--类似于约瑟夫问题(一堆人圈一个圈,按⑦报数,每次淘汰一人,最后一人活)

```
队首出队列一人,将其移至队尾,但人数-1,当人数减为 1 时,剩下的人输使用的变量有: num 常量有: namelist 初始化队列: simqueue = Queue.Queue()设置 for 循环: 队首一人出队列使用 while: num-1,出队列的人移至队尾。
```

## 

```
import Queue

def hotPotato(namelist, num):
    simqueue = Queue.Queue()
    for name in namelist:
        simqueue.put(name)
    while simqueue.qsize()>1:
        for i in range(num):
            simqueue.put(simqueue.get())
        simqueue.get()
    return simqueue.get()

print(hotPotato(["Bill","David","Susan","Jane","Kent","Brad"],7))
```
